Lab Report: Neural Networks — Truth Seeker Dataset

Course: BFOR516 - Advanced Data Analytics for Cyber

Student: Spencer Kone

Date: March 8, 2026

AI Usage Statement

I used Antigravity and Gemini as AI assisted tools for this assignment. Except for the tools mentioned, all content, analysis, and conclusions drawn were made by Spencer Kone.

---

1. Objective

Classify each tweet in the Truth Seeker Dataset as true or false using two neural network models.

Model 1: Linguistic features (text content + writing style metrics)

Model 2: User behavior features (follower counts, bot scores, etc.)

---

2. Data Preparation

2.1 Dataset

Total samples: 134,198

True (1.0): 68,930 (51.4%)

False (0.0): 65,268 (48.6%)

2.2 Feature Engineering

Model 1 combined three sources of information:

- TF-IDF of tweet text (500 features)
- TF-IDF of statement text (500 features)
- 20 numeric linguistic features (word count, verb frequencies, punctuation, etc.)

Total: approximately 1,020 input features.

Model 2 used 9 numeric features:

- followers_count
- friends_count
- favourites_count
- statuses_count
- BotScore
- cred
- normalize_influence
- replies
- retweets

2.3 Preprocessing

NaN handling

Missing values are filled with 0 (for numeric variables) or an empty string (for text variables).

StandardScaler

Applied to all numeric features to normalize magnitude differences.

Train/Test split

80/20 split, stratified by target variable.

---

3. Model Architecture

Component	Model 1 (Linguistic)	Model 2 (User Behavior)
Input features	~1,020	9
Hidden Layer 1	Dense(256, ReLU)	Dense(64, ReLU)
Hidden Layer 2	Dense(128, ReLU) + Dropout(0.3)	Dense(32, ReLU) + Dropout(0.3)
Hidden Layer 3	Dense(64, ReLU) + Dropout(0.2)	Dense(16, ReLU) + Dropout(0.1)
Hidden Layer 4	Dense(32, ReLU)	Dense(8, ReLU)
Output	Dense(1, Sigmoid)	Dense(1, Sigmoid)
Optimizer	Adam	Adam
Loss	Binary Crossentropy	Binary Crossentropy

Component	Model 1 (Linguistic)	Model 2 (User Behavior)
Epochs	50	50
Batch Size	64	64

Architecture Rationale

Model 1

The wide network is trained on the full 1018 TF-IDF and numeric features. We choose a wide first layer of 256 neurons in order to allow the model to learn a large number of diverse relations present in the high dimensional, sparse feature space. We then use a series of smaller layers to extract the features that are actually relevant for the task.

Model 2

Model 2 is a narrower network. We have 64 neurons in the first layer, because there are only 9 input features. 256 neurons for only 9 input features means we have almost 2,300 parameters per feature. That is way too many parameters and will result in overfitting the training data noise rather than the underlying patterns.

Dropout

Dropout layers were added in the model aiming to drop out some neurons during the training process so that no single or small group of neurons overly rely on certain features. Some features in the input of Model 1 may be high dimensional and rarely used during training, which also results in overfitting.

---

4. Results

4.1 Model 1: Linguistic Features

Run 1 — Initial Results (before remediation)

Test Accuracy: 0.9973 (99.73%)

Test Loss: 0.0190

Confusion Matrix (Run 1)

	Predicted False	**Predicted True**
Actual False	13,010 (TN)	44 (FP)
Actual True	29 (FN)	13,757 (TP)

One issue that I stumbled upon while reviewing the results of the experiment is the fact that the TF-IDF vectorizers were being fit to the entire dataset before the train/test split is done. As a result the vocabulary and term frequency information is calculated on all tokens in the dataset including those in the test set. This is a form of data leakage. The model is being given a head start on what is in the test set.

Fix Exercise

TF-IDF vectorizers cannot be fit on all samples (train + test) and StandardScaler cannot be fit on classes. It cannot be fit to y_train. They should be fit to the training set and applied to the test set using the transform method. The train/test split should occur before anything is fit in the pipeline.

Run 2 — Corrected Results (after remediation)

Test Accuracy: 0.9972 (99.72%)

Test Loss: 0.0274

Confusion Matrix (Run 2 — Final)

	Predicted False	**Predicted True**
Actual False	13,010 (TN)	44 (FP)
Actual True	31 (FN)	13,755 (TP)

True Negatives: 13,010 — correctly identified false claims

False Positives: 44 — false claims predicted as true

False Negatives: 31 — true claims predicted as false

True Positives: 13,755 — correctly identified true claims

The accuracy changed by only 0.01 percentage points (99.73% vs 99.72%). However, this exercise uncovered an important fact in the data. One of the column statements has a lot of duplicates. In fact, all the fact checked claims are present in the training and test data in a multitude of tweets. These same fact checked claims are still represented by the same phrases which are scattered randomly throughout the rows.

Thus, regardless of the order of the columns that are fit using TF-IDF, the 80/20 rule does not help to address the fact that the statement phrases are frequently present in both the training and test data.

The fact that the model can afford to be very sloppy in this case meaning that the model is almost entirely dependent on the fact that certain statement phrases appear in the data and that

the model still manages to classify fact checked claims with very high accuracy suggests that the model is not learning about the underlying features of fact checked claims.

Instead, it is almost entirely dependent on the statement phrases which are present in the data.

Run 3 — Statement Level Split (Most Rigorous)

Test Accuracy: 0.7722 (77.22%)

Test Loss: 15.6946

Confusion Matrix (Run 3 — Final)

	Predicted False	**Predicted True**
Actual False	8,849 (TN)	4,158 (FP)
Actual True	1,826 (FN)	11,435 (TP)

True Negatives: 8,849 — correctly identified false claims

False Positives: 4,158 — false claims predicted as true (32% of actual false positives)

False Negatives: 1,826 — true claims predicted as false (14% of actual true)

True Positives: 11,435 — correctly identified true claims

Precision (False): 0.83

Recall (False): 0.68

Precision (True): 0.73

Recall (True): 0.86

As expected the 99.72% → 77.22% drop in accuracy when switching from statement to claim language is almost entirely due to the fact that the model was strongly relying on statement language being equal to the input text rather than actually capturing the language patterns.

The accuracy on unseen claim language is 77.22% and the large test loss of 15.69 further supports the idea that the model is overconfident in the predictions for unseen claims.

Training Curves Observation

Training accuracy is shooting up and is almost at 99% after about the 5th epoch and remains stable with occasional dips and spikes between 99 and 100% for the remaining epochs.

Validation accuracy has high variance with oscillations ranging from around 62 to 67% for all 50 epochs and is not following the training accuracy.

Training loss is decreasing and remaining stable.

Validation loss starts around 3, rises to around 14 after 20 epochs, and oscillates with large fluctuations between approximately 6 and 27 before ending around 26 after 50 epochs.

In summary, overfitting is very strong here. The model has memorized the statement vocabulary in the training data and is making highly confident yet strongly mis calibrated predictions on unseen statements.

4.2 Model 2: User Behavior

Run 3 uses the same statement level split as Model 1.

The scaler leakage that we had in Model 2 where we fit the StandardScaler to the full dataset is also fixed in Run 3.

Test Accuracy: 0.5084 (50.84%)

Test Loss: 0.7379

Confusion Matrix (Run 3 — Final)

	Predicted False	**Predicted True**
Actual False	363 (TN)	12,644 (FP)
Actual True	269 (FN)	12,992 (TP)

True Negatives: 363 — correctly identified false claims (only 2.8% of actual false)

False Positives: 12,644 — false claims predicted as true (97.2% miss rate)

False Negatives: 269 — true claims predicted as false

True Positives: 12,992 — correctly identified true claims (98% recall for true)

The model always predicts True for almost all samples and acts as a majority class classifier.

Training Curves Observation

The training and validation accuracy remain constant for all 50 epochs.

Training accuracy hovers around 64 percent.

Validation accuracy remains stuck between 2 and 5 percent.

Training loss decreases from approximately 0.68 to 0.62.

Validation loss remains around 1.03 to 1.05.

Looking at the confusion matrix, the model predicts True for almost all test samples. It does not appear that the model is learning anything useful from the user behavior features.

The lack of change in the plots also suggests that the features do not carry enough signal for the network to learn a meaningful discriminator of true and false for unseen statements.

4.3 Comparison Across All Runs

Metric	Run 1	Run 2	Run 3
Model 1 Accuracy	99.73%	99.72%	77.22%
Model 1 Loss	0.0190	0.0274	15.6946
Model 2 Accuracy	57.07%	57.01%	50.84%
Model 2 Loss	0.6744	0.6744	0.7379

These three runs highlight what causes the improvement. The impact of setting the TF-IDF ordering to be the same from one test case to the next is almost zero.

The impact of setting the statement splits to unseen data is an improvement of about 22 percentage points relative to the baseline for Model 1.

Model 2 learns very little in any of the runs and tends toward random guessing.

---

5. Model Interpretation (Critical Analysis)

5.1 What Worked Well

The accuracy of Model 2 (User Behavior) is only 50.84% (Run 3 statement level split) which is 26 points below the 77.22% accuracy of Model 1 (Linguistic).

This suggests that TF-IDF and the 20 linguistic features derived from real language use may capture distinctive language patterns for true and false statements.

The content based model achieves 77% accuracy on genuinely unseen statements despite being a simple feedforward neural network without any pre trained language model.

Running the three iterations provided the most insights. At first it appeared that Run 1 might be a fluke, so Run 2 was executed after correcting the TF-IDF fit order. Finally Run 3 changed the dataset split and revealed that dataset splitting was far more important than network design.

5.2 What Went Wrong

Model 1 — Statement Repetition Leakage (Fixed)

The initial 99.73% accuracy was caused by statement repetition between train and test rows. After fixing this and performing a statement level split, accuracy dropped to 77.22%.

Test loss increased to 15.69.

Model 2 — Majority Class Collapse

At 50.84% accuracy with the statement level split, Model 2 predicts True for nearly the entire dataset. Recall for the False class is only 2.8%.

The user behavior features appear to have little discriminative power for this task.

5.3 Feature Selection Analysis

Model 1 uses both traditional and engineered features. Words and phrases in the tweet or statement text are often very important.

POS tag counts for adjectives, pronouns, and expressive punctuation such as exclamation marks and question marks can provide signal.

NER percentages for infrequent classes are less useful.

In Model 2, the most important features appear to be BotScore and cred, which represent account credibility.

Raw counts such as followers_count and statuses_count appear to have very little impact.

This makes sense because account activity level does not directly correspond to truthfulness.

Possible future features include sentiment scores, credibility of sources, publication timing of claims, and cross referencing with fact checking databases.

5.4 Hyperparameter Tuning Rationale

Epochs = 50

This is a reasonable starting point given the dataset size of 134K samples. Model 1 converged early, while Model 2 showed no meaningful patterns even after extended training.

Batch size = 64

This balances gradient noise and memory usage. Smaller batches produce noisy updates while very large batches reduce generalization.

Dropout rates

Higher dropout was applied in earlier layers to combat overfitting, with lighter dropout deeper in the network.

Learning rate

The Adam default learning rate of 0.001 was used initially. After experimentation, it was reduced to 0.0001 after 40 epochs to improve convergence.

If re running the experiment, the main focus would be eliminating data leakage and expanding Model 2 with additional behavioral features.

---

6. Feature Engineering Suggestions

Several improvements could substantially boost performance.

Combined model (text + behavior)

Combining linguistic features with behavioral signals could provide a stronger signal.

Sentiment and subjectivity scores

Libraries such as TextBlob or VADER could quantify emotional tone.

Claim age and temporal features

Older debunked claims may reappear frequently and could influence classification.

Network features

Retweet source credibility or previous fact checks could provide valuable context.

Cross domain generalization

The dataset currently focuses on U.S. political fact checking and may not generalize to health, science, or international misinformation.

7. Conclusion

This lab evolved through three experimental runs examining evaluation design and model behavior.

Run	Split Strategy	Model 1 Accuracy	Model 2 Accuracy
Run 1	Row level split with TF-IDF fit on full dataset	99.73%	57.07%
Run 2	Row level split with TF-IDF fit on training data only	99.72%	57.01%
Run 3	Statement level split (final)	77.22%	50.84%

The final result shows that linguistic content predicts factual accuracy with a 77.22% correlation on truly unseen examples.

User behavior features perform close to random guessing at 50.84%.

The key methodological lesson is that correcting evaluation design errors has a much larger impact than small preprocessing changes.

The Truth Seeker Dataset assigns a single fact check label to many rows, which creates a risk of leakage if not handled carefully.

Misinformation detection remains a difficult language task. Even simple TF-IDF features combined with a feedforward network can reach around 77% accuracy on unseen claims.
